Session

Week 2, Day 3

In web development, CSS (Cascading Style Sheets) plays a crucial role in controlling the layout and positioning of HTML elements. Understanding how to control the display and positioning of elements is essential for creating visually appealing and well-structured web pages.

Display Property

The `display` property specifies how an HTML element is displayed on the web page. It determines whether an element is treated as a block-level or inline-level element and, in some cases, influences its behavior and visibility.

Common `display` Property Values

1. `block`

- Elements with `display: block` take up the full width of their parent container, pushing other elements to appear below.
- Commonly used for structural elements like `<div>`, `<p>`, and headings.

2.
